

Dining Philosophers Layer 2

This project uses the Asymmetric Deadlock Prevention Strategy to ensure smooth and safe coordination among the philosopher threads. In this method, philosophers follow different rules when picking up chopsticks: odd-numbered philosophers always pick up their left chopstick first, while even-numbered philosophers pick up their right chopstick first. By forcing them to follow opposite ordering, we break the circular wait condition, which is one of the major causes of deadlock in concurrent systems.

Compilation Process:

First I use oracle virtual box which is what we use last sem during our operation system class then to compile the program in Ubuntu or any Linux environment, run:

```
gcc -pthread dining_philosophers.c -o dining_philosophers
```

Execution Instructions

Run the program using:

```
./dining_philosophers
```

Let it run for 3–5 minutes while observing output to confirm:

- No philosopher is stuck forever (deadlock-free)

- All philosophers eventually get a chance to eat (no starvation)

To stop the program safely, press:

Ctrl + C

```
yrone@yrome:~$ cd-Layer2-Dining-Philosophers
cd-Layer2-Dining-Philosophers: command not found
yrone@yrome:~$ cd Layer2-Dining-Philosophers
yrone@yrome:~/Layer2-Dining-Philosophers$ gcc -pthread dining_philosophers..c-o dining_philosophers
gcc: pthread: command not found
yrone@yrome:~/Layer2-Dining-Philosophers$ gcc -pthread dining_philosophers.c -o dining_phisophers
yrone@yrome:~/Layer2-Dining-Philosophers$ ./dining_philosophers
